

KEYBOARD ENCODER (JIS CODE STANDARD PRODUCT)

DESCRIPTION

The M58609-04P,S is a keyboard encoder for read switches of terminal equipment. It is fabricated using P-channel aluminum-gate MOS technology and is packaged in a 40-pin DIL package. It contains a 3168-bit mask-programmable read-only memory, and the 8-bit codes specified in JIS C-6220-1969 "Codes for Information Interchange" are stored in the ROM. The output consists of an 8-bit code and a parity bit. The address is selected by the 8-bit and 11-bit ring counters.

FEATURES

- TTL/DTL-compatible (except X, Y terminals)
- Two-key rollover operation
- Self-contained clock generator circuit
- Strobe delay circuit for eliminating key contact bounce
- External control for output polarity (positive or negative logic)
- External control for selecting odd or even parity

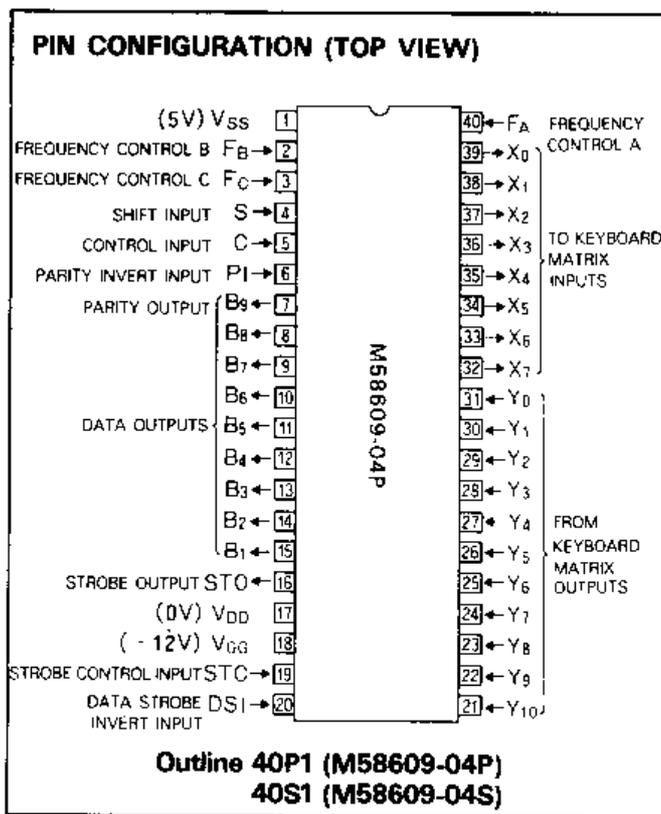

APPLICATION

- Encoder for full-keyboard terminal equipment

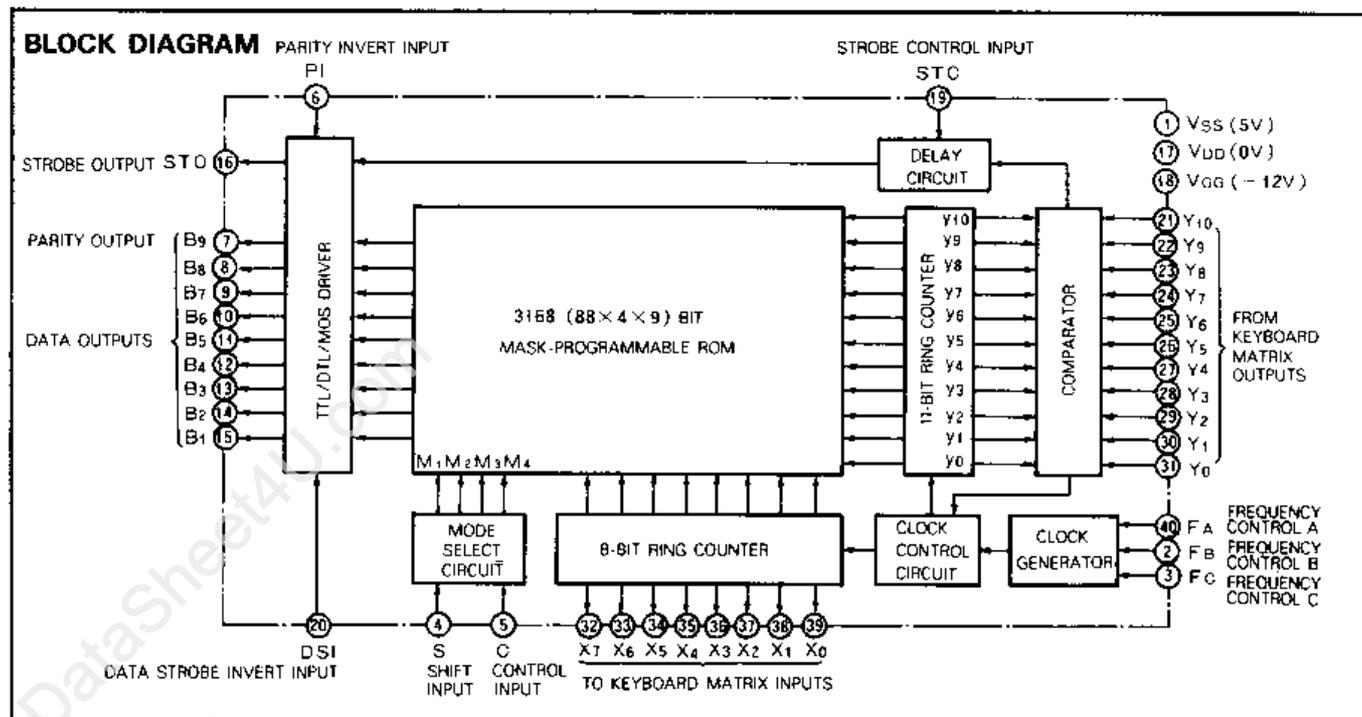

FUNCTION

Outputs (X₀~X₇) of the 8-bit ring counter and inputs (Y₀~Y₁₀) of the 11-bit comparator are wired to the keyboard to form an 8×11 (88-cross points) switch matrix.

When the key connected with X_i and Y_j is depressed, a path is formed between them. When the level of Y_j matches that of X_i, which comes from the 8-bit ring counter, the comparator generates a coincidence signal for clock control and delay circuit. This clock control stops the clock signals

to the ring counter and data outputs (B₁~B₉) stabilizing the selected 9-bit code. The stabilization is indicated by a valid signal on the strobe output. A strobe output signal is generated at the time set by the externally controlled delay circuit which receives the coincidence signal. Data outputs and strobe output remain stable until the key is released.

M58609-04P, S

KEYBOARD ENCODER (JIS CODE STANDARD PRODUCT)

FUNCTION (Data Output and Parity Output)

The relationships between $B_1 \sim B_8$ in the code table and $B_1 \sim B_8$ in data outputs are shown in Table 1, and those between the parity output B_9 and the parity bit, in Table 2. The parity bit in the table is defined as a '0' when the number of '1's in the code $B_1 \sim B_8$ is odd and a '1' when it is even.

Mode selection is shown in Table 3.

Table 1 Relationship between code table and data outputs

| $B_1 \sim B_8$ Code table | Data strobe invert input DSI | Data output $B_1 \sim B_8$ | Logic |
|------------------------------|------------------------------------|-------------------------------|----------------|
| 1 | L | H | Positive logic |
| 1 | H | L | Negative logic |
| 0 | L | L | Positive logic |
| 0 | H | H | Negative logic |

Table 2 Parity output

| Parity bit | Parity invert input PI | Parity output B_9 |
|------------|---------------------------|------------------------|
| 1 | L | H |
| 1 | H | L |
| 0 | L | L |
| 0 | H | H |

Table 3 Mode selection

| Shift input S | Control input C | Selected mode |
|------------------|--------------------|---------------|
| L | L | 1 |
| H | L | 2 |
| L | H | 3 |
| H | H | 4 |

CODE TABLE (JIS C-6220-1969)

| | | | | | | | | | | | | | | | | DEL | | | | | | | | | | |

* B_9 is an odd parity bit for the 8-bit code ($B_1 \sim B_8$)

Note 1 A '1' or '0' in the code table indicates that the output level goes high for '1' and low for '0' when input DSI and PI are low-level.

| V _{IH} | High-level input voltage | V _{SS} - 1 | | | V |
| V _{IL} | Low-level input voltage | | | 0.8 | V |
| f (φ) | Clock frequency | 20 | 50 | 100 | kHz |
| t _{D(STO)} | Strobe delay time | | 1.5 | | ms |
| R _{OFF} | Switch off resistance | 10 | | | MΩ |
| R _{ON} | Switch on resistance | | | 300 | Ω |

ELECTRICAL CHARACTERISTICS (T_a = -20 ~ 75°C, V_{GG} = -12 ± 1V, V_{SS} = 5 ± 0.5V, V_{DD} = 0V, unless otherwise noted)

| Symbol | Parameter | Test conditions | Limits | | | Unit |
|--|--|---|-----------------------|-----|-----|------|
| | | | Min | Typ | Max | |
| V _{OH} (B _i , STO) | High-level output voltage, B ₁ ~ B ₉ and STO | I _{OH} = -100 μA | V _{SS} - 1 | | | V |
| V _{OH} (X _i) | High-level output voltage, X ₀ ~ X ₇ | I _{OH} = -100 μA | V _{SS} - 1.3 | | | V |
| V _{OL} (B _i , STO) | Low-level output voltage, B ₁ ~ B ₉ and STO | I _{OL} = 1.6 mA | | | 0.4 | V |
| V _{OL} (X _i) | Low-level output voltage, X ₀ ~ X ₇ | I _{OL} = 1 μA | | | -3 | V |
| R _I | Input resistance, S, C, DSI and PI | V _I = -12V | 1 | | | MΩ |
| P _d | Power dissipation | T _a = 25°C | | 70 | 200 | mW |
| C _i | Input capacitance | V _I = 0V, f = 1 MHz, T _a = 25°C | | | 15 | pF |

Note 2: Current flowing into an IC is positive; out is negative.

TIMING DIAGRAM

Note 3: DSI = "L"

- 4. (X_i, Y_i) KEY indicates the key switch that is located at the cross point of X_i and Y_i of the keyboard matrix.
- 5. (X_i, Y_i) OUTPUT indicates the code output of the key that is selected by the (X_i, Y_i) KEY.

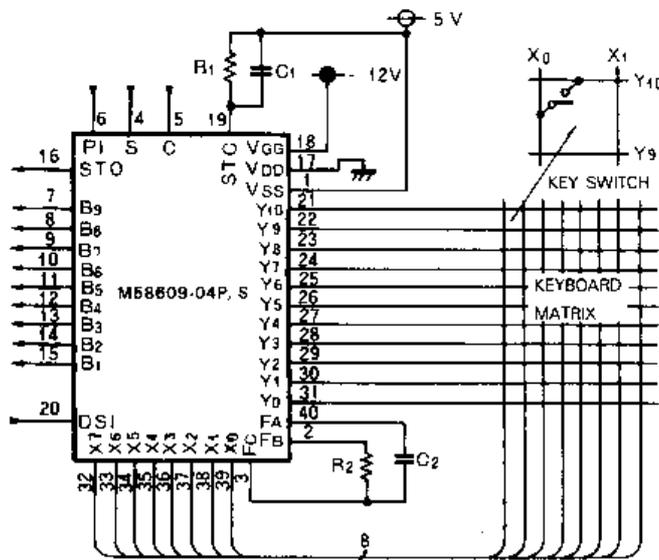

KEYBOARD ENCODER (JIS CODE STANDARD PRODUCT)

FUNCTION TABLES

| Data (B ₁ ~ B ₉) Invert | | | Strobe (STO) Invert | | | Parity (B ₉) Invert | | | Mode Select | | |
|--|---|--|---------------------|--------------------------|--------------|---------------------------------|------------------------------|------------------------|-------------|-----------|----------------|
| DSI (Pin 20) | Code table (B ₁ ~ B ₉) | Data output (B ₁ ~ B ₉) | DSI (Pin 20) | Internal strobe (Note 3) | STO (Pin 16) | P1 (Pin 6) | Code table (B ₉) | B ₉ (Pin 7) | S (Pin 4) | C (Pin 5) | Mode |
| H | 1 | L | H | H | L | H | 1 | L | L | L | M ₁ |
| L | 1 | H | L | H | H | L | 1 | H | L | L | M ₂ |
| H | 0 | H | H | L | H | H | 0 | H | L | H | M ₃ |
| L | 0 | L | L | L | L | L | 0 | L | H | H | M ₄ |

Note 6: The internal signal of the strobe output (STO) becomes high-level when the strobe signal is generated.

TYPICAL APPLICATION CIRCUIT

Note 7: R₁ = 1.5MΩ, C₁ = 0.001μF provides approximately 15ms delay time.
8: R₂ = 75kΩ, C₂ = 50pF provides approximately 50kHz clock frequency.

Cautions in Use

1. Coupling at the Keyboard Matrix

Depending on the capacitance of the keyboard matrix wiring, depressing one key while another is depressed gives rise to capacitance coupling, which may result in repetition of the strobe output, the same condition that would occur if a single key were depressed twice. In this case, proceed as shown in Fig. 1.

2. N-Key Rollover

This device is for 2-key rollover; when 3 or more keys are depressed simultaneously, code output is indeterminate.

3. Maximum Chatter Times

1. With Key Off (t_{KOFF})

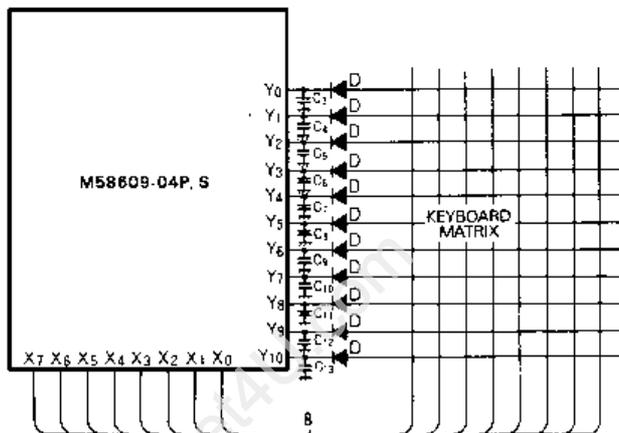

t_{KOFF} is defined as the maximum time that, when a key is turned on but because of faulty contact, etc. the key input signal chatters, the chattering can be disregarded. This may vary according to ambient temperature, power supply conditions, etc., but is approximately 100ns.

2. With Key On (t_{KON})

Conversely, t_{KON} is the maximum time that, when a key is turned off, but the input signal chatters, the chattering condition can be disregarded.

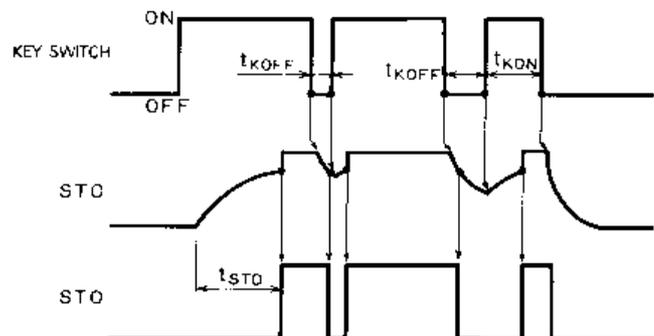

when $t_{KOFF} \leq 1/f_{\phi}$ $t_{KON} \leq 100ns$
 when $t_{KOFF} > 1/f_{\phi}$ $t_{KON} \leq t_{STD} + t_{SC}$
 where: f_{ϕ} = clock frequency
 t_{STD} = strobe delay time
 t_{SC} = scanning time

Fig. 1 Measures against coupling

Insert diodes and capacitors (C₃ ~ D₁₃) should be approx. 50 ~ 100pF between the keyboard matrix and the Y inputs.

Fig. 2 Timing diagram for maximum chatter time
